

Early Journal Content on JSTOR, Free to Anyone in the World

This article is one of nearly 500,000 scholarly works digitized and made freely available to everyone in the world by JSTOR.

Known as the Early Journal Content, this set of works include research articles, news, letters, and other writings published in more than 200 of the oldest leading academic journals. The works date from the mid-seventeenth to the early twentieth centuries.

We encourage people to read and share the Early Journal Content openly and to tell others that this resource exists. People may post this content online or redistribute in any way for non-commercial purposes.

JSTOR is a digital library of academic journals, books, and primary source objects. JSTOR helps people discover, use, and build upon a wide range of content through a powerful research and teaching platform, and preserves this content for future generations. JSTOR is part of ITHAKA, a not-for-profit organization that also includes Ithaka S+R and Portico. For more information about JSTOR, please contact support@jstor.org.

NO. II.

Description of a new species of Sarracenia. By Thomas Nuttall. Read May 7th, 1830.

AMONG the more curious new species of plants which I have lately detected, in a pedestrian tour of twelve hundred miles through the states of South Carolina, Georgia, Alabama and Florida, is the following:

SARRACENIA *CALCEOLATA.

Pumila; ascidiis reclinatis, tubo ventricoso, operculo subgloboso-inflato carinato, gine intruso-inflexo, ore subrotundo parvo.

A very distinct and dwarf species, about the relative size Description. of S. adunca, but lower. The autumnal ascidia are furnished with broad leafy ridges running along the upper edge of the tube; these appendages become much narrower in the vernal ones, but their very similar character throughout each section of the genus renders their specific employ wholly useless: the ordinary ascidia are short and reclinate, with a ventricose tube scarcely ever exceeding three or four The operculum (unlike all the other species) is inches in length. confluent with the tube and of a singular, inflated, globular form, carinate above, bluntly pointed and uncinately curved, with the edges broadly inflected, so as to leave only a circular opening, as in the lip of the Cypripedium, which this appendage indeed wholly resembles: its colour is usually a fine purple-red, varied and reticulated with varioloid diaphanous whitish meshes somewhat similar to those of the operculum

Vol. IV.—N

of S. variolaris; the inner side of the tube is almost throughout lined with long coarse reflected hairs, which must thus render it a formidable trap to all winged insects. Interfoliar stipules small and ovate. Scape a little longer than the ascidium. Flowers nearly the size of those of S. purpurea, the petals lingulate-oblong, dark blood-red; twice the length of the calyx; the angles of the peltate stigma deeply emarginate.

Habitat. West Florida, near Tallahassee (ten miles west, rare). Very abundant in Tatnal county, Georgia, particularly within a few miles of the new court-house; growing with S. variolaris and S. flava, in the drier sphagnous marshes, by the margins of the "Bay-galls" or ponds, in the usual sandy pine-forests. Flowering time, March to April:—confined to about the latitude of thirty to thirty-two degrees.

Observation 1st. The natural affinity of this very singular North American genus continues to demand investigation. After many fruitless attempts on my own part, I have at length had the satisfaction of observing the germination of S. purpurea in the collection of Mr Hibbert of Philadelphia, who very opportunely called my attention to the subject; this species, then, has perfectly distinct, long, linear cotyledons; probably, from their appearance, folded and involute within the seed. At present, we cannot but consider the Sarracenia as the type of a distinct order Sarraceniaceæ, bearing some remote affinity perhaps with the Nympheaceæ. Most of the species are confined to the more temperate regions south of Virginia.

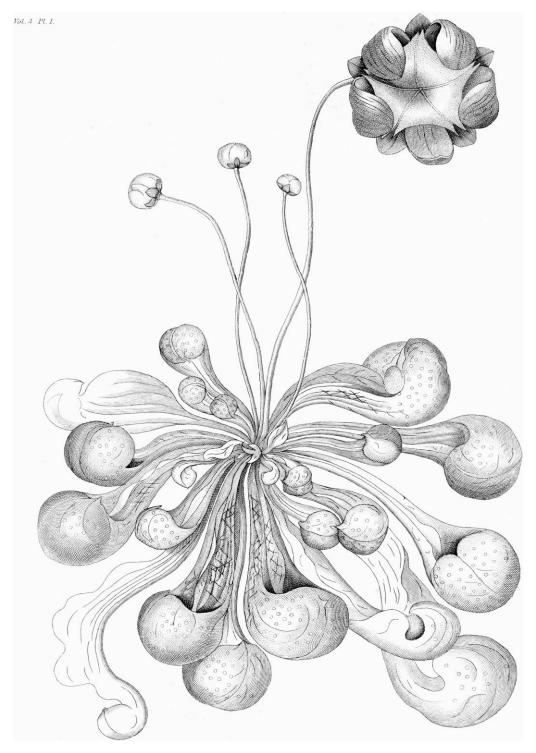

Observation 2d. The genus now presents three sections in the form of the ascidia.

In the first, the ascidia are erect and tubular, in the form of trumpets, with the operculum *free* and reflected. In this are included *S. flava* and *S. Catesbyana*, lately restored by Mr Elliott. In these the flowers are yellow*.

* To the first section (with S. flava and S. Catesbyana) may also be added, to me an obscure species, S. rubra of Walter, "foliis erectis tubulatis, valva plana erecta," which, as Mr Hooker remarks in his Exotic Flora, Vol. I. p. 14, cannot certainly be the S. psittacina of Micheaux, (a species with which I am familiar from the very places quoted by the discoverer), in which the operculum is always strongly recurved as well as arched. The figure given by Mr Hooker, t. 13, also perfectly accords with Walter's character; the ascidium in fact being erect, and very similar to that of S. flava, except in the greater dilatation of the summit of the tube. In this species the flower is a deep red.

In the second section, the ascidia are ventricose and reclinate, with the operculum *free* and arched over the aperture of the tube. The relative order of this section to the preceding will be *S. adunca*, somewhat allied to the preceding in the almost erect tube;—then *S. purpurea*, of which, near Northampton, Massachusetts, there exists a yellow-flowered variety;—*S. variolaris*, with the operculum also strongly arched, and marked with diaphanous reticular meshes, the flowers yellow; in the two other species they are a dark brownish red.

Our present new species, S. calceolata, will form a third section, characterized by producing reclinate ventricose ascidia, having the operculum confluent with the tube, and with the margin reflected inwards, so as to leave only a circular foramen passing into the tube; it is also like S. variolaris, marked with diaphanous discoloured meshes. The flower is deep red. This is the most southern species yet discovered, and confined apparently to about the parallel of the thirtieth degree.

J. Whittield Del!
